REST API Demo

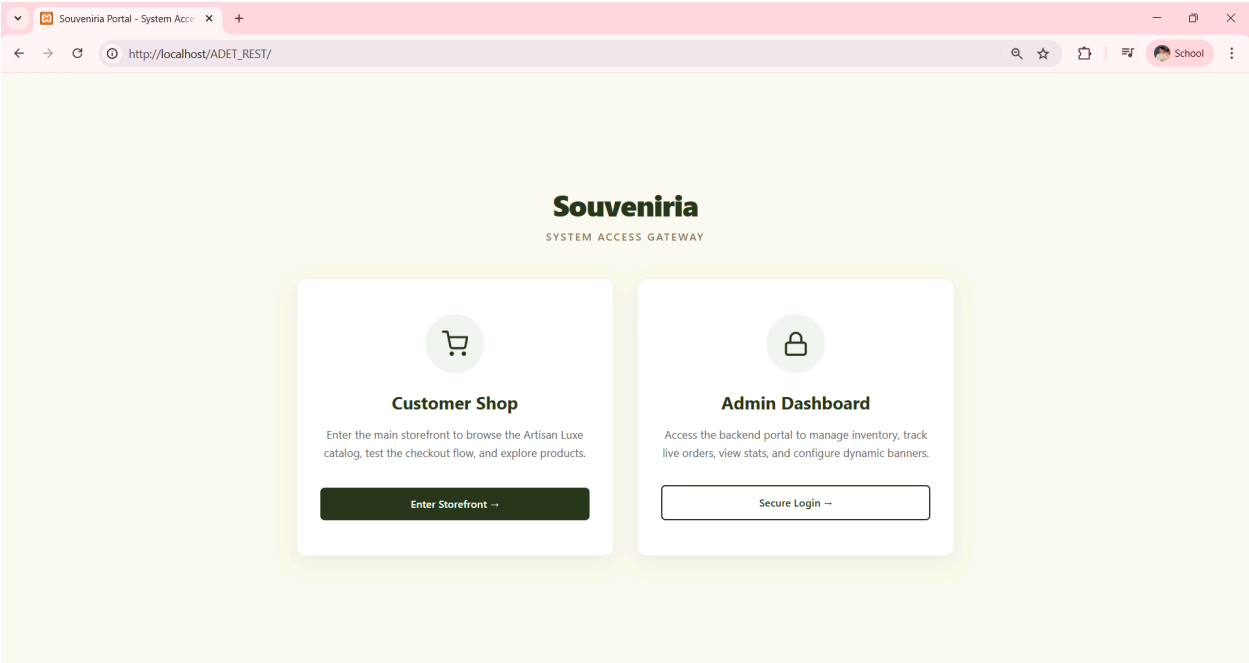

Figure 1. *Role Login Selection Page*

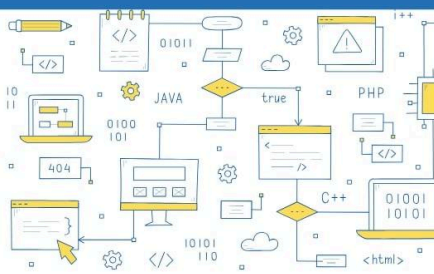
The **Souveniria System Access Gateway** is the centralized portal that directs traffic based on user roles, powered by the core Authentication System (login.php). It presents two distinct access routes:

- **Customer Shop:** This pathway grants access to the main storefront for browsing the catalog and testing the checkout flow. Regular users routed here rely on the Account Retrieval System (account.php) to load their profiles and the Profile Update System (update_account.php) to securely manage their synchronized personal and location data.

- **Admin Dashboard:** A restricted portal requiring secure login credentials. Validated by the is_admin flag, this route grants authorized personnel access to backend management tools, allowing them to oversee users via the Administrative Directory (list_customers.php) and maintain database hygiene through the Deletion & Cleanup System (delete_customer.php).



1. Customer Client

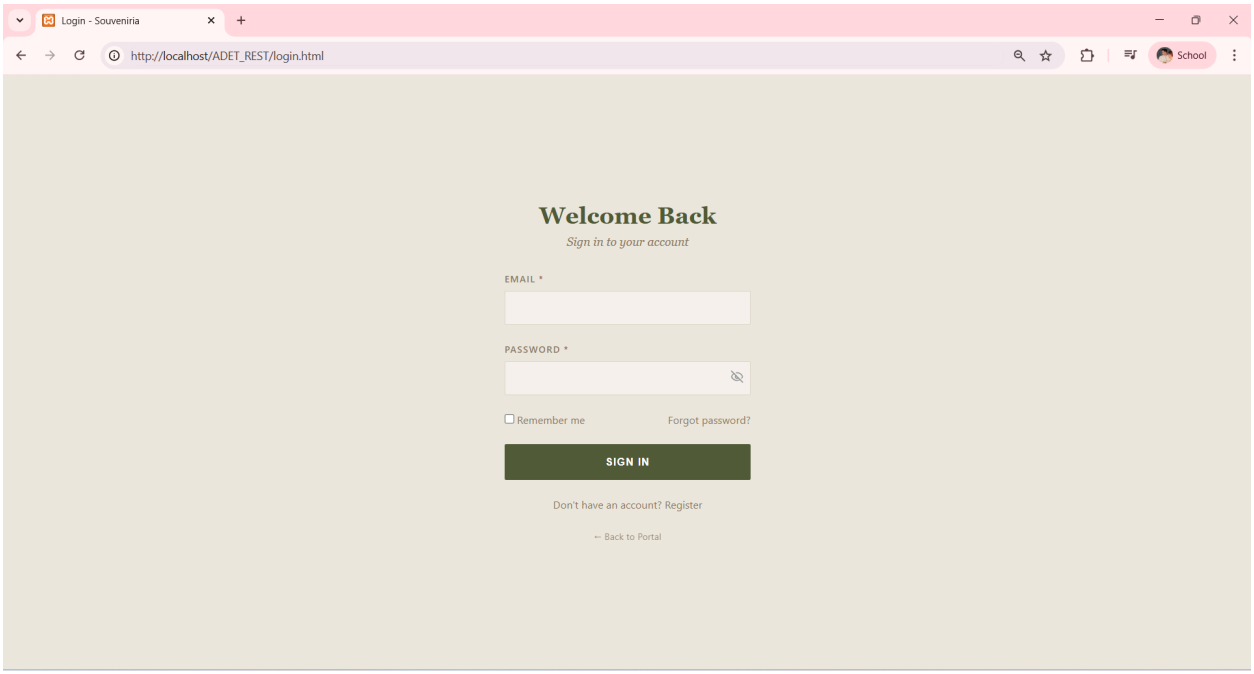


Figure 2. *Customer Login Selection Page*

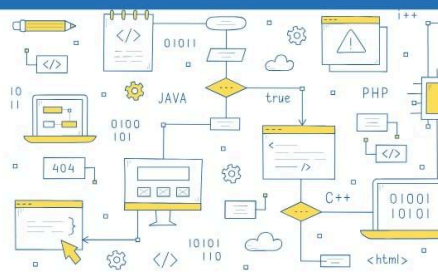
The **Souveniria Authentication System** is the secure gateway that validates user credentials to grant system access. Powered by the login.php API, this interface captures the user's email and password to verify them against the database.



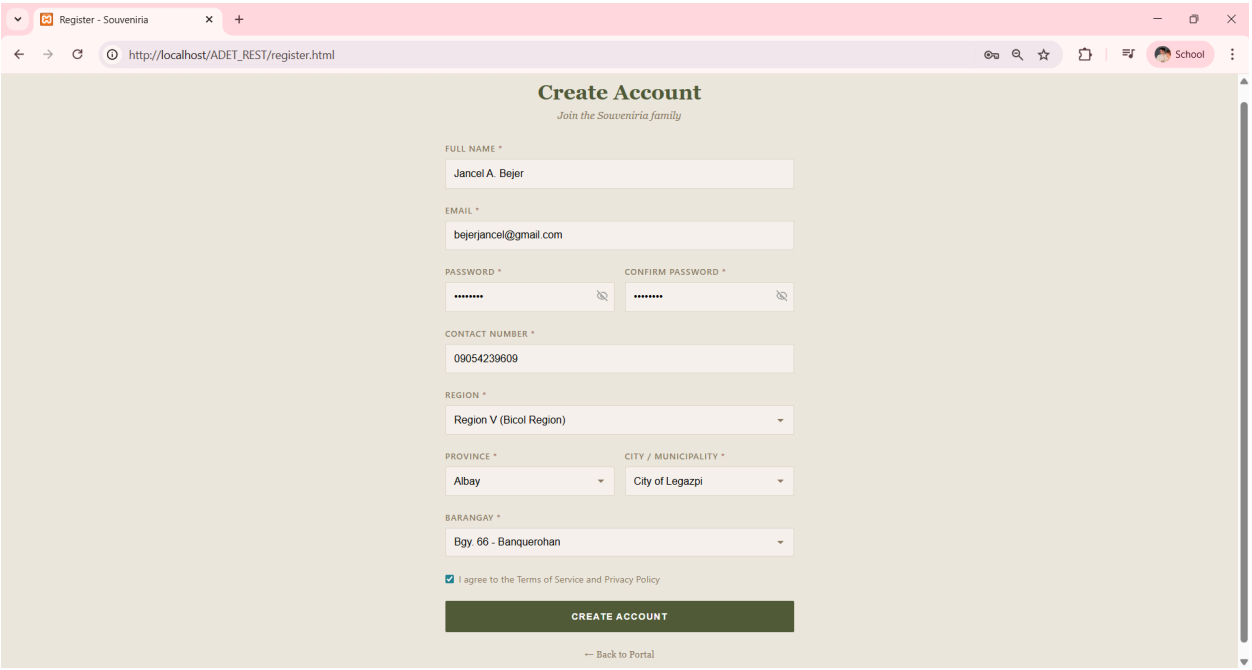


Figure 3. *Customer Registration Page*

The **Souveniria Registration System** is the onboarding gateway designed to capture a user's unique identity and geographical location through the register.php API. This interface facilitates a simultaneous multi-table database link to ensure every new account is perfectly synchronized with a specific address record.

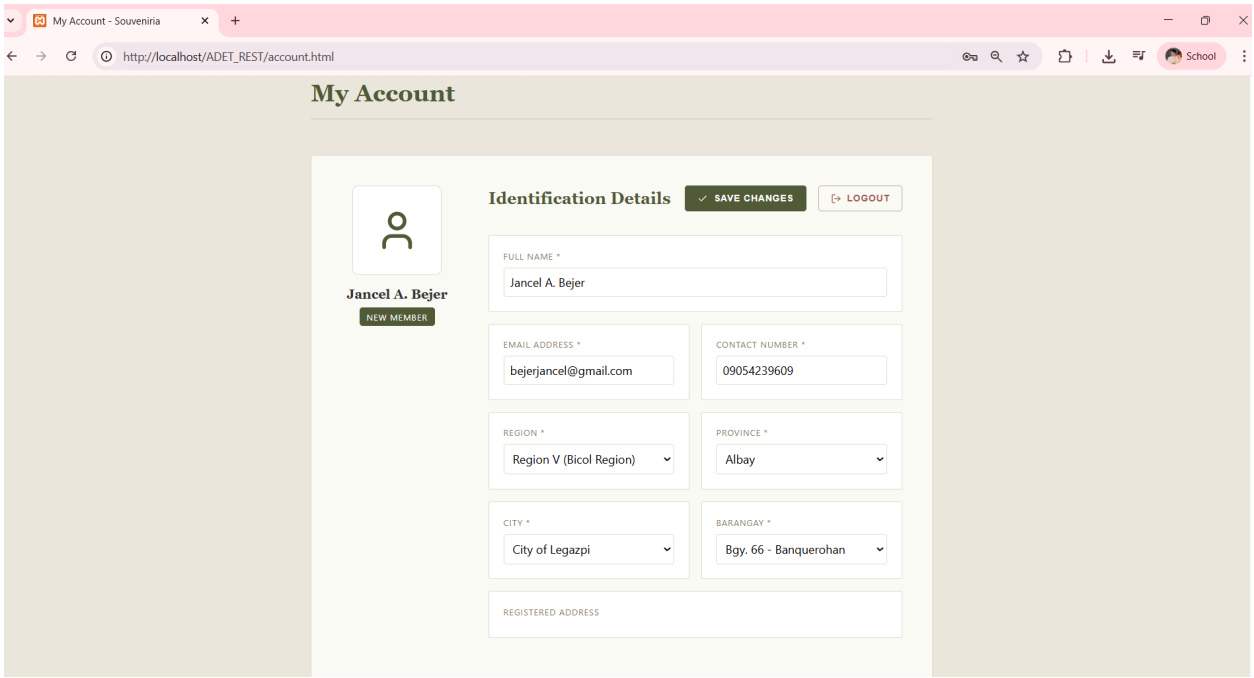

Figure 4. *Customer Profile*

The **Souveniria Account Management System** serves as the primary dashboard for viewing and editing user details, driven by the account.php and update_account.php APIs. This interface acts as an intelligent data reader that generates a complete overview of a user's identity by processing a single User ID.

2. Admin Client

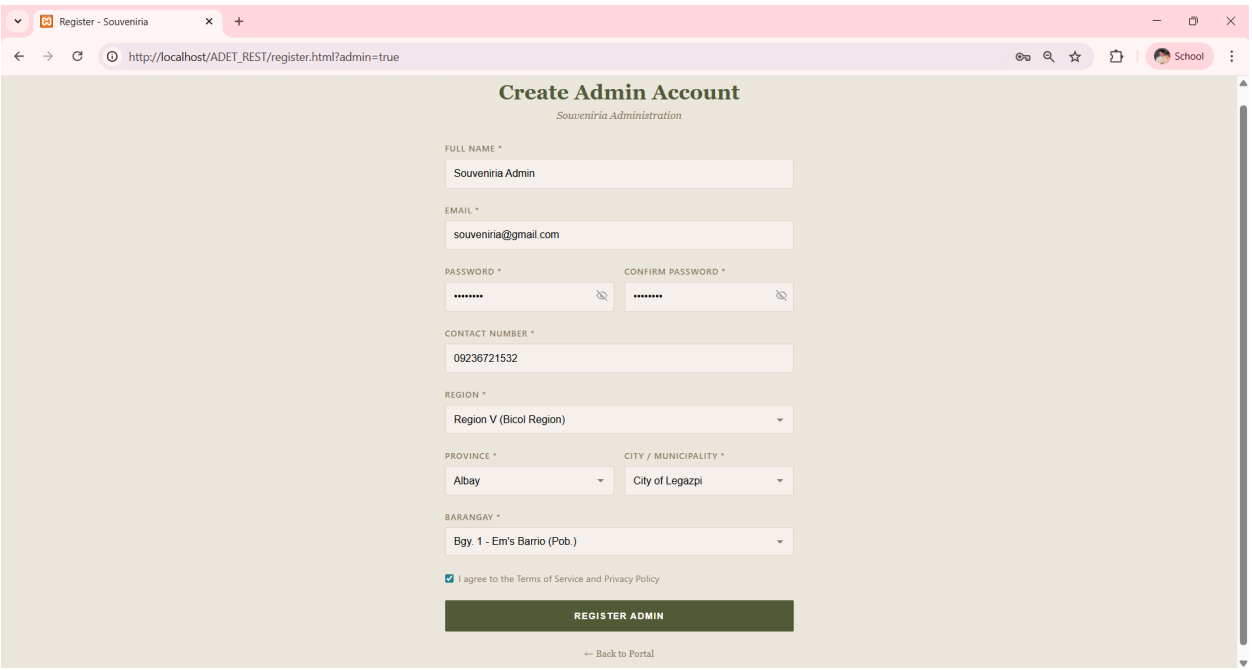

Figure 5. *Admin Registration Page*

The **Souveniria Admin Registration System** is a specialized onboarding module that establishes high-level access for system administrators through the register.php API. This interface is specifically configured via the *is_admin flag*, ensuring that the created account is routed to the administrative table rather than the standard customer directory.

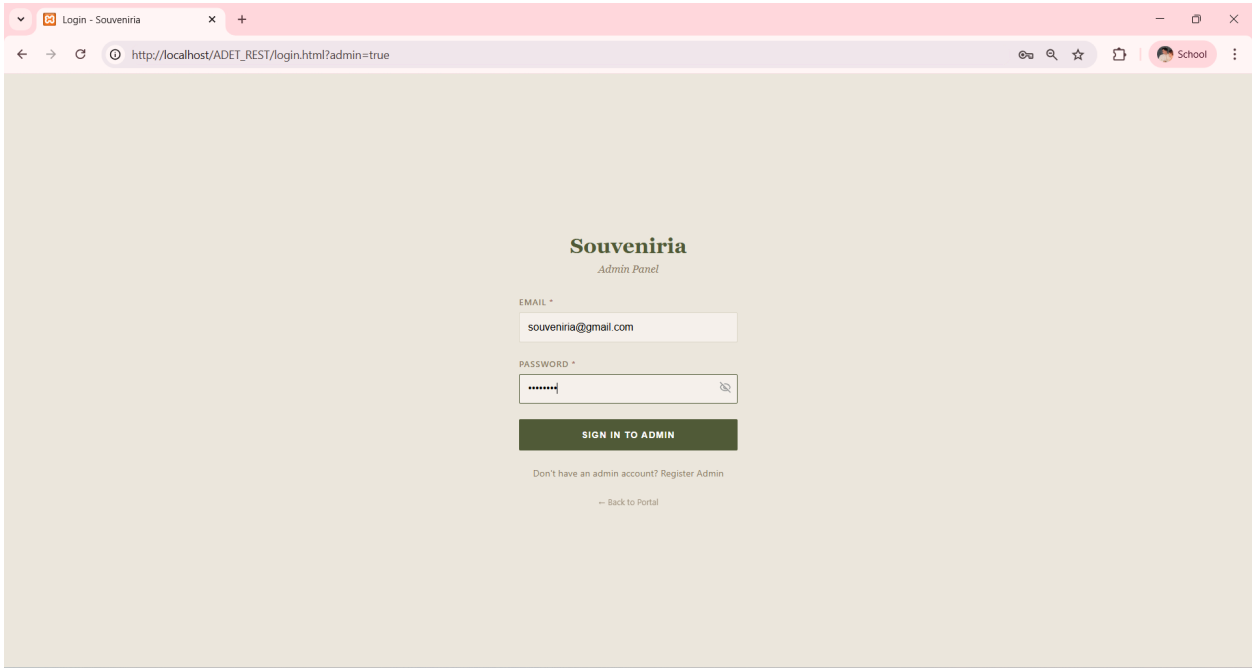

Figure 6. *Admin Login Page*

The **Souveniria Admin Panel Login** is the specialized authentication gateway for system administrators, operating through the *login.php* API. This interface serves as a high-security entry point that explicitly validates credentials against the administrative records in the database.

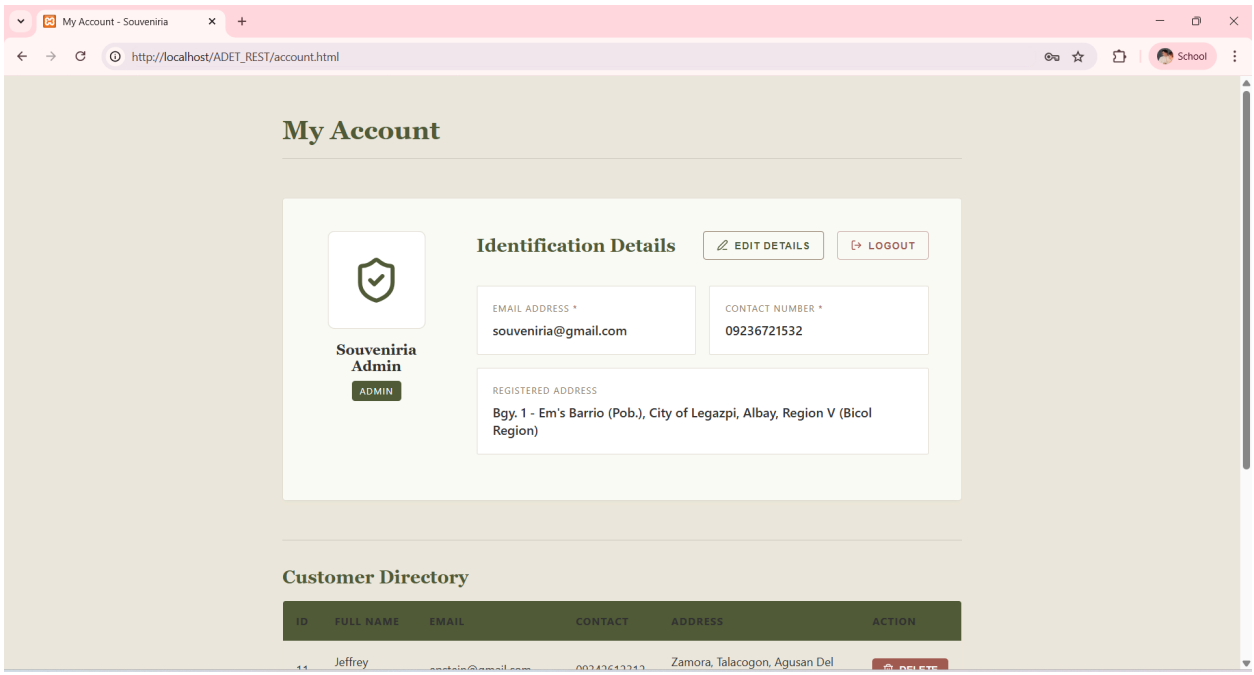

Figure 7. *Admin Profile*

The **Souveniria Administrative Dashboard** serves as the central command center for system management, integrating profile oversight with the Administrative Directory (list_customers.php) and the Deletion & Cleanup System (delete_customer.php).

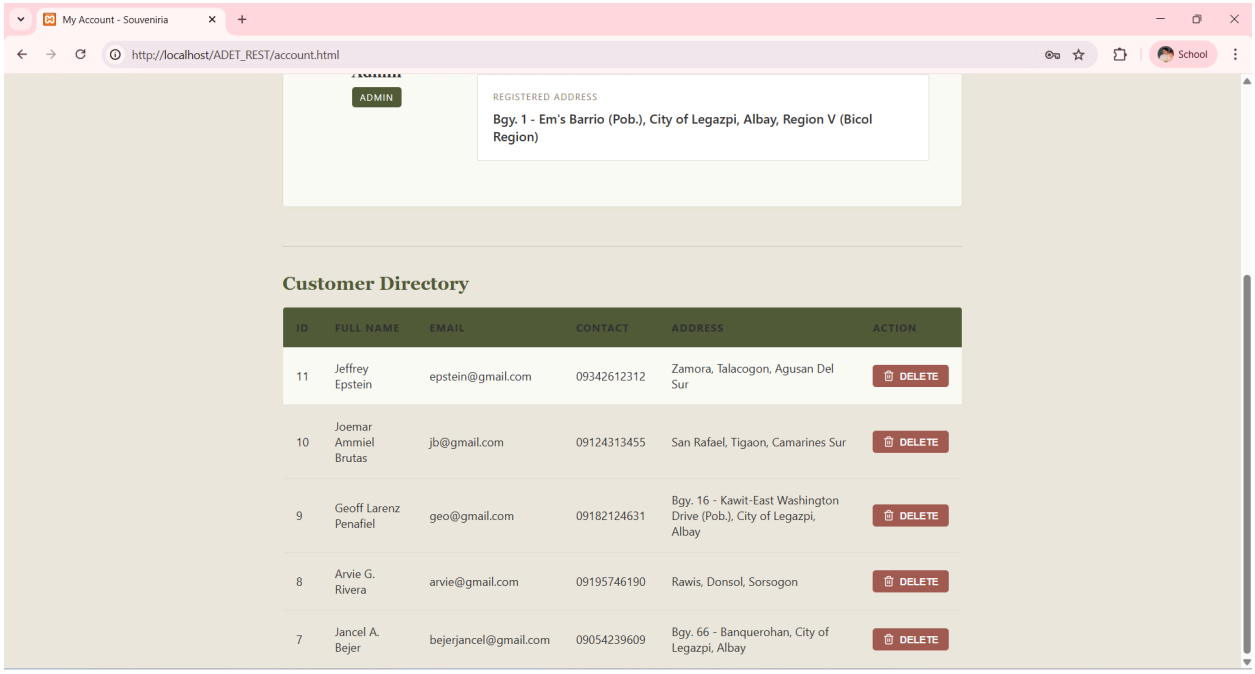

Figure 8. Admin *Customer Directory*

The **Souveniria Administrative Directory** functions as a centralized reporting tool that provides management with full oversight of all registered accounts. This interface is powered by the list_customers.php API, which retrieves a real-time, structured list of customer records including their unique IDs, full names, contact information, and geographical locations.

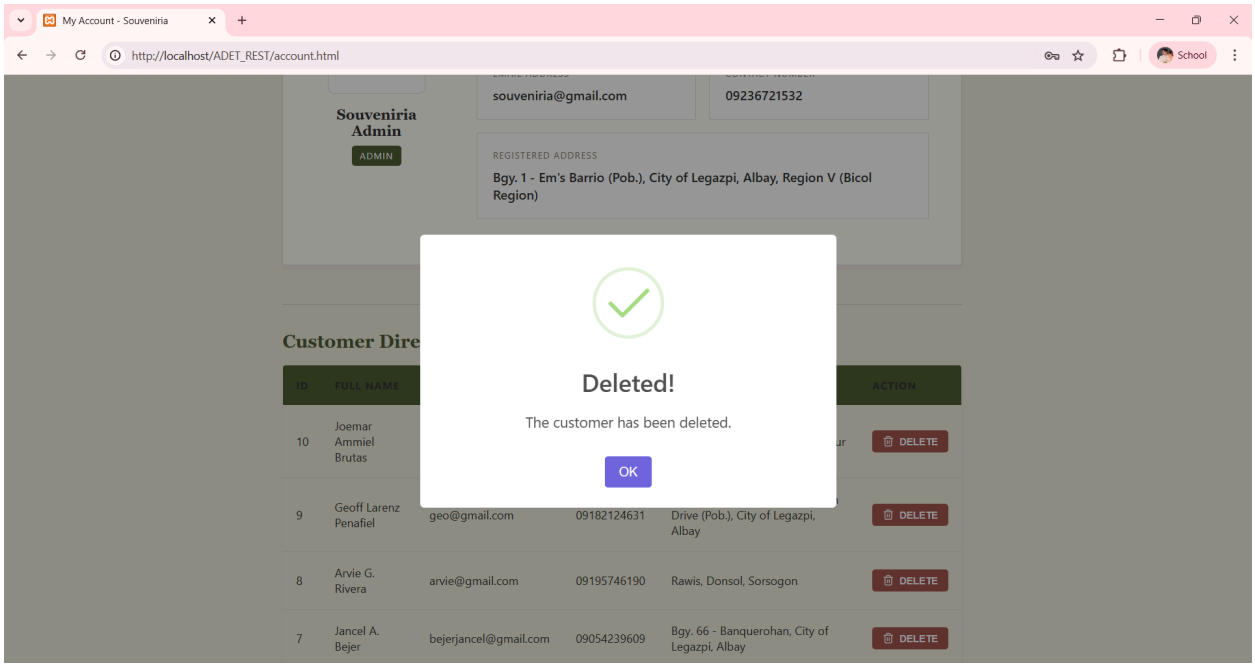

Figure 9. *Admin Customer Tracker Deletion*

The **Souveniria Deletion & Cleanup System** is shown here completing a specialized administrative action through the delete_customer.php API. This interface provides a confirmation of the "cascade approach" used to maintain the integrity and cleanliness of the system's database.

Database

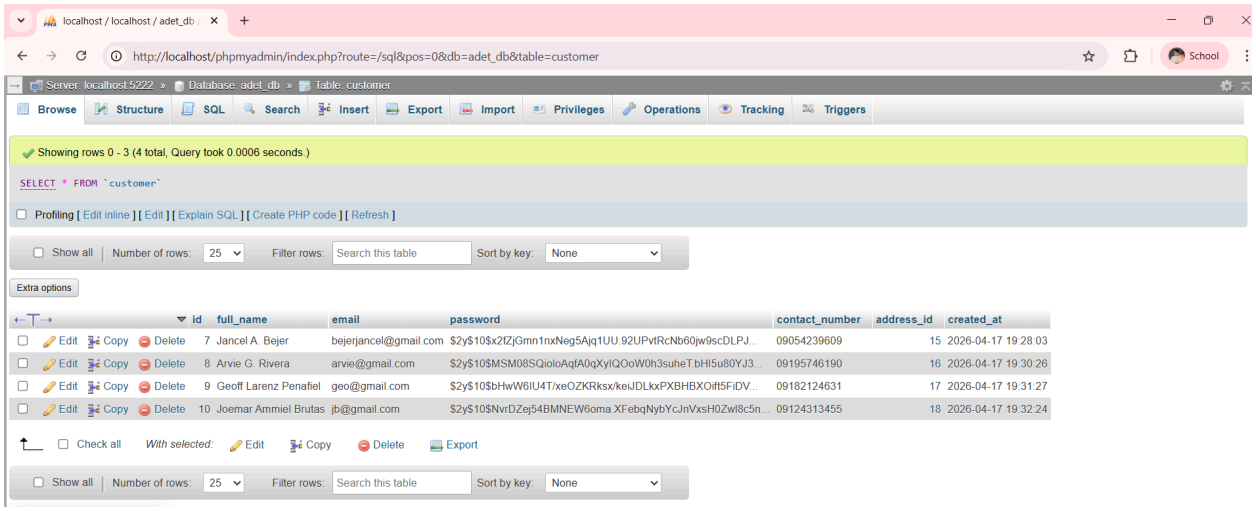

Figure 10. *Customer Table*

The **Souveniria Customer Table** is the primary storage structure within the adet_db database, containing the synchronized identity records of all registered users. This table is the central repository where the Registration System (register.php) commits new user data and the Authentication System (login.php) verifies credentials.

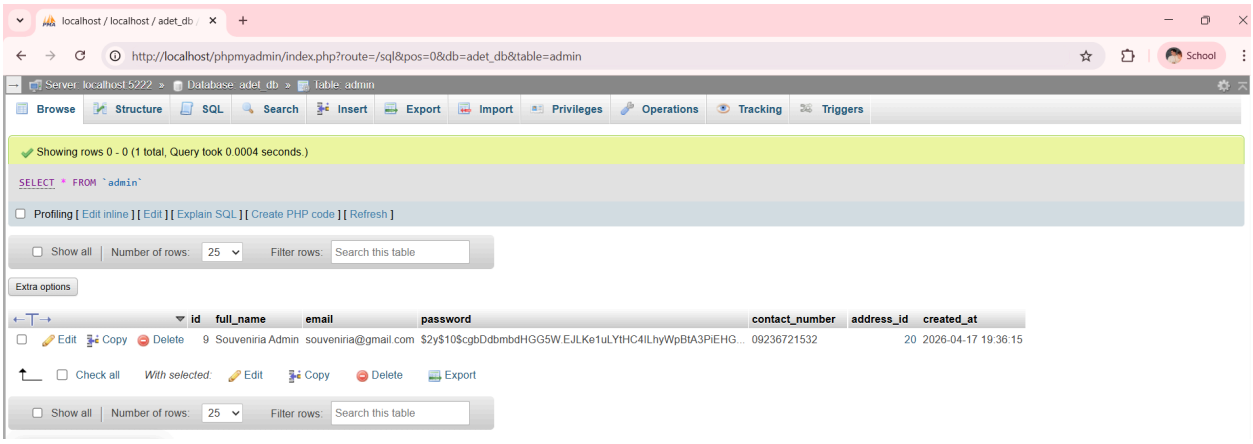

Figure 11. *Admin Table*

The **Souveniria Admin Table** is the dedicated storage structure for privileged accounts within the adet_db environment. This table is specifically utilized by the Authentication System (login.php) whenever the is_admin flag is set to true, ensuring a strict separation between standard customers and system managers.

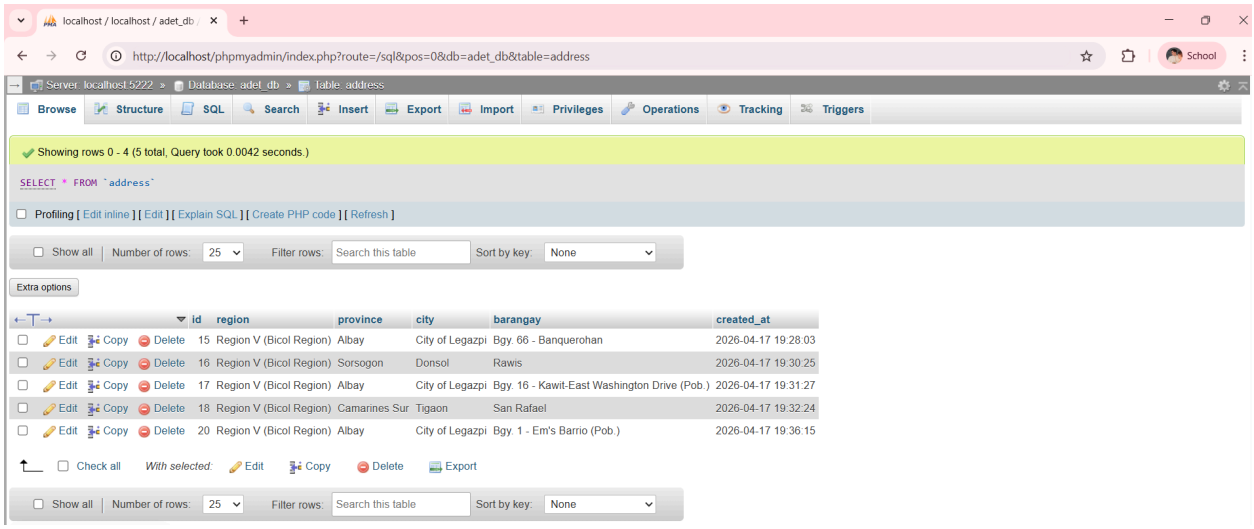

Figure 12. *Address Table*

The **Souveniria Address Table** is the specialized geographical repository within the adet_db database, designed to store location data with professional accuracy. It functions as the foundational half of the platform's multi-table synchronization logic, supporting the Registration System (register.php) and the Profile Update System (update_account.php).
